The specification describes chimeric expression promoters. These chimeric promoters comprise a nucleic acid sequence which is derived from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter originates from the Cassava vain mossic virus. Especially, the promoters are
                                                                                                                                                                              Nakagawa

```

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum.

These

mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are useful for identifying the mutation point of a gene derived from a mutant of corymeform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Corymeform bacterium, and identifying a homologue of a gene derived from corymeform bacterium. Corymeform bacteria are useful for producing amino acide, nucleic acide, vitamins, saccharides and organic acide, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.
                                                                                                                                                                     Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          271214
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-DEC-1999;

The invention relates to novel genes (ABL89449-ABL90853) and proteins CC (ABB99040-ABB99444) useful for preventing, treating or ameliorating CC medical conditions e.g. by protein or gene therapy. The genes are CC isolated from a range of human tissues disclosed in the genes are CC me nucleic acids, proteins, antibodies and (ant)agonists are useful CC in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast CC and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune CC haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's Cdisease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and CC epilepsy; and (f) infectious diseases such as viral, bacterial, fungal CC note: The sequence data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the isolation of novel human enzyme cc polypeptides (AAU22915-AAU23814), and the cDNA and genomic sequences cc encoding them. The enzyme polypeptides of the invention may comprise the cf functional classes of exidoreductases, transferases, hydrolases, lyasses, it can be remarked to a control of the invention are useful in the cd disgnosis, treatment, prevention and/or prognosis of a wide range of cd disorders including hyperproliferative disorders (e.g. cancer), cc immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. cancer), cc (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), cc (e.g. arthritis), neurological disorders (e.g. Alzheimer's disorders (e.g. anthritis), neurological disorders (e.g. Alzheimer's disorders (e.g. arthritis) and infectious disorders (e.g. atherosclerosis), cc (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), cc (e.g. infertility) and infectious disorders (e.g. inflammatory disorders (e.g. infertility) and infectious disorders (e.g. inflammatory disorders (e.g. infertility) and infectious disorders (e.g. inflammatory disorders (e.g. infertility) and infectious disorders (e.g. infertility). The sequence of the invention can also be used in gene therapy. cc AAS40785-AAS41894 represent cDNA sequences encoding for the novel human enzyme polypeptides of the invention.

Cc Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at figure and specification, but was obtained in electronic format directly from WIPO at figure and specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

Sequences AAS29511-AAS29736 represent cDNA molecules, which encode the endocrine polypeptides of the invention. Endocrine polypeptides and thei associated polynucleotides of the invention are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A
                                                                            Isolated polypeptide for treating, preventing and/ or prognosing disorders of the endocrine system such as reproductive disorders, endocrine cancers and also for testing and detection e.g. diagnos

The treatable cdisorders include autoimmune diseases such as rheumatoid arthritis, chyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular cdisorders such as cardiac arrest, cerebrovascular cdisorders such as cardiac arrest, cerebrovascular cdisorders such as corneal infection, nervous system disorders such as cardiac arrest, cerebrovascular coular disorders such as corneal infection, endocrine disorders such as corneature labour and infertility, gastrointestinal disorders such as corneature labour and infertility, gastrointestinal disorders such as corneature labour and infertility, gastrointestinal disorders such as corneature labour and infertility as a sthma. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, to maintain corgans before transplantation, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to correase or decrease storage capabilities.

Sequences AAS29511-AAS29736 represent cDNA molecules, which encode the endocrine polypeptides of the invention. Endocrine polypeptides and their associated polymucleotides of the invention are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polymucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular alsonders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular and fungi, alzheimer's disease, infections caused by bacteria, viruses and fungi,
                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polypeptide for treating, preventing and/ or prognosing disorders of the endocrine system such as reproductive disorders, endocrine cancers and also for testing and detection e.g. diagnosis
                                                                                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rosen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ocular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, gastrointestinal disorders such as Crohn's disease, renal disorders such as glomerulonephritis and respiratory disorders such as asthma. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, to maintain organs before transplantation, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; oxidoreductase enzyme; transferase; hydrolase; lyase; isomerase ligase; hyperproliferative disorder; immunodeficiency disorder; autoimmune disorder; neurological disorder; metabolic disorder; inflammatory disorder; cardiovascular disorder; reproductive disorder; blood-related disorder; infectious disorder; gene therapy; cytostatic;

The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the CDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lysses, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders
                         Note: The sequence data for this patent did not specification, but was obtained in electronic for at ftp.wipo.int/pub/published_pct_sequences.
                                                                      metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynuclectides of the invention can also be used in gene therapy. AAS40785-AAS41684 represent cDNA sequences encoding for the novel human enzyme polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2001-465566/50.

RESULT 11
AAF13367
CC expression of genes in a first filamentous fungal (FF) cell relative to ceapression of the same genes in one or more second filamentous fungal (CC cells. The method uses fluorescence-labeled nucleic acids isolated from CC the FF cells and a substrate of expressed sequence tags (EST). The ESTs CC are used in the methods for monitoring differential expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the CC same genes in one or more second filamentous fungal cells. Monitoring CC the global expression of genes from FF cells allows the production CC potential of the microorganisms to be improved. New genes may be CC discovered, possible functions of unknown open reading frames can be CC discovered, possible functions of unknown open reading frames can be CC discovered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore CC monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore CC morphogenesis, recombination, metabolic or catabolic pathway compineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an CC array equals one gene or open reading frame, and organisation of the CC microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11237 represents ESTs from Aspergillus CC ricar. AEF11647 represents ESTs from Aspergillus and COVIDER and COVI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁

                                   The present sequence is a DNA encoding Aspergillus oryzae lysophospholipase-1 (LLPL-1). Lysophospholipase is an enzyme that hydrolyses lysophospholipids into fatty acids. The DNA encoding LLPL-1 is cloned into a plasmid present in Escherichia coli deposit number DSM 13082. Lysophospholipase is used to hydrolyse fatty acyl groups in a phospholipid or lysophospholipid and for improving filterability of an aqueous solution or slurry of carbohydrate origin which contains phospholipid and preferably a starch hydrolysate, particularly wheat starch hydrolysate. Lysophospholipase is also used to release fatty acids from intact phospholipid e.g. lecithin, and in the preparation of bakery products such as dough, bread, and cakes to improve elasticity. Lysophospholipase is used to reduce the phospholipid content in an edible bil e.g. vegetable oils such as rape seed oil, soybean oil and
                                                                                                                                                                                                                                                  New lysophospholipase enzyme useful in hydrolyzing fatty acyl groups a phospholipid or lysophospholipid, and in improving filterability of an aqueous solution or slurry of carbohydrate origin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lysophospholipase; LLPL-1; lysophospholipid; lecithin; bakery product; dough; bread; cake; elasticity; edible soybean; sunflower; ds.

                                                                                                                                                                            strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified essential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus funigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAS23403 represent C. albicans essential gene knockout upstream PCR primers (KO-Up) used in the methods of the

RESULT 1 US-09-026-033-1/c

Sequence 1, Application US/09026033 Patent No. 6368791

GENERAL INFORMATION:
APPLICANT: Felix, Carc
APPLICANT: Jones, Doug
APPLICANT: Rappaport,

Felix, Carolyn A. Jones, Douglas H.

NUMBER OF COUNTRY OF THE PROPERTY OF THE PROPERTY OF CORRESPONDENCE ADDRESS: PANTICH SCHWARZE JACOBS & NADEL, P.C.
ADDRESSEE: PANTICH SCHWARZE JACOBS & NADEL, P.C.
ADDRESSEE: One Commerce Square, 2005 Market Street, 22nd

Philadelphia

NUMBER OF SEQUENCES:

TITLE OF INVENTION: METHOD AND KITS FOR ANALYSIS TITLE OF INVENTION: CHROMOSOMAL REARRANGEMENTS AS

ASSOCIATED WITH LEUKEMIA

Eric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       s: plasmid ends
quality sequence stop: 665
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competents. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note="Vector: PWD42nv; Purified genomic musculus C57BL/6J (male) was obtained fi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Laboratory Mouse DNA Resource

/note="vector: pME18S-FL3; Site_1: DTAILI (CACCATGTG);
Site_2: DTAILI (CACTGTGTG); 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DTAILI adaptor
[TGTTGGCCTACTGG], digested and cloned into distinct DTAILI
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed and donated by Dr. Sumio
Sugano (University of Tokyo Institute of Medical Science).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Conservative
                                                                                                                                  (Promega). cDNA was synthesized using both formers in separate reactions and equipped with coligo(dT) primers in separate reactions and equipped with EcoRI adaptors. Library was size-fractionated on agarose gels (for insert size >400bp) and non-directionally cloned into EcoRI-digested pUC19 vector. Blue/white selection on carbenicillin-containing plates was used to recover positive clones."

                                                                                                                                                                     /note="Wector: pr773D-Pac (Pharmacia) with a modified polylinker; Site 1: Not I; Site 2: Boo RI; The UI-R-C2p library is a subtracted library derived from the UI-R-C1 library, which is a subtracted library derived from the UI-R-C1 library, which is a subtracted library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C2p) was constructed as follows: PCR amplified CDNA inserts from UI-R-C1 clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography.
                           791-806,
1 88 c
                                           converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-C2p library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6 791-806, 1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Soares,

The plants were watered every day and twice a week with a modified nutrient long mahton solution without phosphate but with a high level of nitrate. After 3 weeks RNA was extracted from whole root systems. CDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into Uni-zap XR vector from Strategene and packaged using Gigapack Gold packaging extracts. Plasmids containing cDNA inserts were mass-excised from phage stocks using Exassit helper phage and propagated in SOIR cells. Clone ordering and sequencing was performed by the Centre National de Sequencage (Genoscope, Evry, France). Note: EST may be of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note-"Vector: pSPORT1 (Invitrogen); Site_1: Sall; Site_2: NotI; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 1154199]). Total RNAs were obtained from Dr. Janet Rossant and Tilo Kunath (Samuel Lumenfeld Research Institute, Canada). Double-stranded
                                                                                                                                     4 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with Sal1 and NotI enzymes and cloned into Sal1/NotI site of pSPORTI plasmid vector. The DH10B B. coll host was transformed with the ligation mixture by the crandary decrease.
                   mixture by the standard chemical method. The average insert size is about 2.6 kb. The library was constructed by Yulan Piao (NIA)."
